- The surrounding wireless environment can cause the wireless network service to run slowly.
- If you do not turn off the entire local home network, network traffic may occur on some devices.
- For an AP connection, an access point device that supports wireless connection is required and the wireless connection feature must be enabled on the device. Contact your service provider regarding availability of wireless connection on your access point.
- Check the SSID and security settings of the AP for AP connection. Refer to the appropriate documentation for SSID and security settings of the AP.
- Invalid settings on network devices (wired/wireless line sharer, hub) can cause the monitor to run slowly or not operate properly. Install the devices correctly according to the appropriate manual and set the network.
- Connection method may differ according to the AP manufacturer.

- Vertical frequency: The product display functions by the screen image changing dozens of times every second like a fluorescent lamp. The vertical frequency or refresh rate is the number of image displays per second. The unit is Hz.
- Horizontal frequency: The horizontal interval is the time taken to display one horizontal line. When 1 is divided by the horizontal interval, the number of horizontal lines displayed every second can be tabulated as the horizontal frequency. The unit is kHz.

# TO CONTROL MULTIPLE PRODUCTS

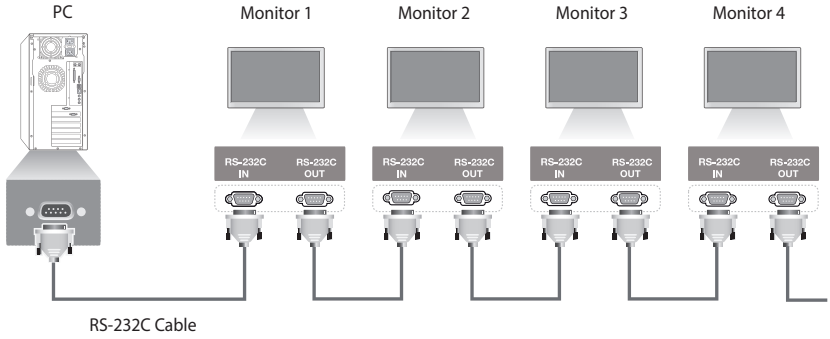

Use this method to connect several products to a single PC. You can control several products at a time by connecting them to a single PC.

In the Installation menu, the Set ID must be between 1 and 1000 without being duplicated.

## Connecting the cable

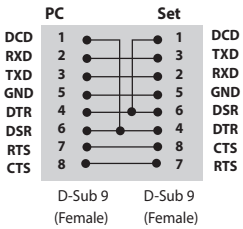

Connect the RS-232C cable as shown in the picture.

The RS-232C protocol is used for communication between the PC and product. You can turn the product on or off, select an input source or adjust the OSD menu from your PC.

## RS-232C Configurations

**8-Wire Configurations (Standard RS-232C cable)**

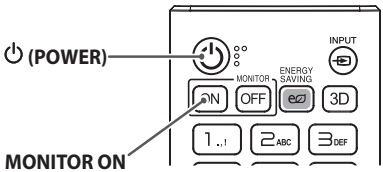

## Communication Parameter

Baud Rate: 9600 BPS
Data Length: 8 bit
Parity Bit: None
Stop Bit: 1 bit
Flow Control: None
Communication Code: ASCII code
Use a crossed (reverse) cable

## NOTE

- When using three-wire connections (non-standard), an IR daisy chain cannot be used.
- When monitors connected via Daisy Chain (that controls multiple monitors) are turned off and on successively, some monitors may not turn on. In this case, you can turn those monitors on by pressing the **MONITOR ON** button, not the **POWER** button.

# Transmission/Reception Protocol

## Transmission

**[Command1][Command2][ ][Set ID][ ][Data][Cr]**

- [Command1]: identifies between the factory setting and the user setting modes.
- [Command2]: controls monitor sets.
- [Set ID]: Used for selecting a set you want to control. A unique Set ID can be assigned to each set ranging from 1 to 255 (01H~FFH) under Settings in the OSD menu.
  - Selecting '00H' for Set ID allows the simultaneous control of all connected monitors.
  - The maximum value of Set ID may differ depending on the model.
- [Data]: Transmits command data.
  - Data count may increase depending on the command.
- [Cr]: Carriage Return. Corresponds to '0x0D' in ASCII code.
- [ ]: White Space. Corresponds to '0x20' in ASCII code.

## Acknowledgement

**[Command2][ ][Set ID][ ][OK/NG][Data][x]**

- The Product transmits ACK (acknowledgement) based on this format when receiving normal data. At this time, if the data is FF, it indicates the present status data. If the data is in data write mode, it returns the data of the PC computer.
- If a command is sent with Set ID '00' (=0x00), the data is reflected to all monitor sets and each monitor set does not send an acknowledgement (ACK).
- If the data value 'FF' is sent in control mode via RS-232C, the current setting value of a function can be checked (only for some functions).
- Some commands are not supported depending upon the model.

**01. Power (Command: k a)**

Controls the power on/off of the set.

Transmission
